

ARGUS

Auditable AI QA

Self-healing test automation your clients can actually trust — and **verify**.

A new premium service line · powered by Argus

AI is commoditizing what QA firms bill for

Test frameworks now **self-heal**. Automation and maintenance hours — the core of the bill — are becoming “free in the tool.”

Clients are starting to ask: *why pay for QA the tool does for free?*

The part that doesn't commoditize

Trust — proof that testing was actually done, done correctly, and didn't quietly bury a real bug. That's the premium a QA firm is uniquely positioned to own.

Three things, in the client's words

Self-healing tests

When the UI drifts, the test repairs itself instead of failing — cutting the biggest cost in E2E: maintenance.

A signed, auditable report

Every result ships with verifiable proof of what was tested and what passed. A client-facing deliverable, not an internal log.

Won't mask real bugs

Built to surface genuine failures, not “heal” them into a false green — and the audit trail proves it.

Client experience: faster cycles · fewer false failures · a tamper-evident report they can hand to *their* auditor.

It's real. Let me show you.

Three beats: heal → receipt → refuse.

Self-healing: drift repairs itself

A dev renames a button's data-testid. Cosmetic drift. Today = a red build + an hour of an engineer's time.

test fails ×

triage: dom-drift

rewrite locator

re-run: green ✓

opens PR

The single biggest cost in E2E — maintenance — drops to near-zero.

But healing is now free in the tools. Here's what isn't. →

Self-healing QA you can audit

Every run produces a **signed, tamper-evident receipt**: every tool call + decision, hashed and chained, signed by an **independent notary**.

”Don’t take my word for it — **you** verify it.”

`treeship.dev/receipt/ssn_b965f6f0a82f1294`

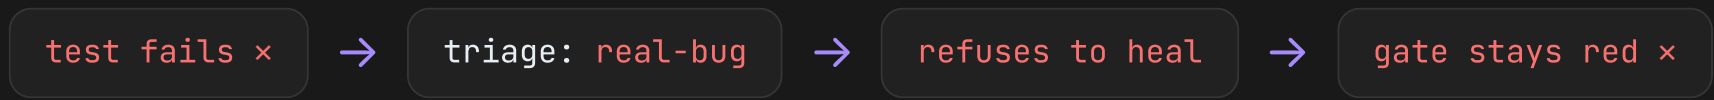

Honesty: proves what happened — verifiable & auditable. Not a claim that the agent's judgment is infallible.

```
$ argus heal --spec checkout.spec.ts
triage → dom-drift (locator stale)
heal → rewrote getByRole('button')
verify → 12 passed (green)
pr → #42 opened
```

✓ verified · 21 artifacts · chain intact

It won't mask a real bug

The fear with self-healing: does it paper over real failures to stay green? Watch — login now rejects valid credentials.

Heals the noise. **Escalates the signal.** The audit trail proves which call it made — and why.

That combination is the trust you can charge for.

How the proof works

1 · hash each step

2 · chain the records

3 · sign the session

4 · independent notary

- **Tamper-evident:** change any step and every hash after it breaks → "chain intact" means no breaks.
- **Unforgeable:** signed with a private key we don't hold; verifiable by anyone with the public key.
- **Credible to third parties:** a separate system signs it — not Argus marking its own homework.

A premium service line

Margin

Less time on test maintenance per engagement.

Differentiation

“AI QA you can audit” — something low-cost AI tools can’t offer.

Premium billing

Auditable proof justifies a higher-value tier.

Enterprise & compliance

Regulated clients need verifiable evidence, not assurances.

Where it runs

Web — now

Available today. This is where a pilot starts.

Mobile — near-term

On the roadmap; the execution layer is built to slot in a mobile driver.

CTV / streaming

Roku, Fire TV, smart TVs. We **wrap existing** CTV test tooling in the audit layer — not replace it.

The model: turn the hardest, most expensive QA line into the one you can *guarantee* — with proof.

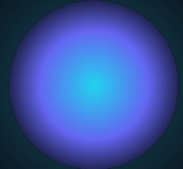

One web client. Two metrics. Near-zero lift.

We handle integration end-to-end. Nothing for your team to build or maintain — **capability + delivery**, not a tool to license.

If it doesn't deliver, nothing is lost. If it does, we formalize it across your client base.

SUCCESS METRICS

- 1 • Test-maintenance hours saved
- 2 • Client response to the auditable report

Pick one web client.

Let's run the pilot.
